Subject: Control of Radioactive Contamination

ATI Flat rolled Products has active radioactive testing programs which monitor incoming raw materials and heat samples for evidence of radiation. Our program for monitoring deliveries of raw materials commenced in 1996 and our program for monitoring heat samples commenced prior to 2000. Raw materials or heats having radiation levels above normal background are not permitted to be used. Any radioactive elements present as residuals are the results of their common occurrence in nature and are at levels not significantly above background.

ATI Flat Rolled Products' Radiation Control Program conforms to the applicable principles of EU Directive 96/29/Euratom.

Sincerely,

Mark R. Shirey
